This document describes the purpose, features, workflow, visual interface, and technical implementation of Tasky

App Overview

Tasky is an Android application for task management which helps users to create, organise, keep track of, and carry out the tasks they have every day. Each task can have a title, some notes, a priority level, a category, and a due date. On the main screen you will find a summary of the progress as well as search facilities and filters according to task status.

Main Objectives

- Provide a simple interface for creating and managing tasks.
- Organize tasks using priority and category.
- Support due dates and identification of overdue tasks.
- Provide search and status-based filtering.
- Show task completion progress at a glance.
- Store tasks locally so task management does not require an online service.

Core Features

Feature	Function
Create Task	Creates a task with title, notes, priority, category, and optional due date.
Priority	Assigns Low, Medium, or High priority.
Categories	Organizes tasks into Personal, Work, Study, or Health.
Due Date	Assigns a deadline and supports date-based filters.
Search	Searches task title, notes, and category.
Filters	Displays All, Today, Upcoming, Overdue, or Done tasks.
Progress	Displays completed-task count and percentage.
Edit	Updates an existing task.
Delete	Removes an individual task.
Completion	Marks a task complete and makes it available in Done.
Local Storage	Stores task data locally using Room.

Main Interface

The main screen of Tasky contains the most common task-management tools in one place. The header displays the app's name and the number of completed tasks. The progress card below shows the percentage of completed tasks. The search field and status filters are below the progress card. Cards with tasks are located at the bottom of the screen, and a floating New task button initiates task creation.

Main Screen Elements:

Header

Shows the Tasky name and the completed/total task count.

Progress Card

Shows the number of completed tasks and the overall completion percentage.

Search

Filters the visible tasks according to the entered text.

Filter Row

Allows users to switch between different task-status views.

Task Card

Displays the task title, notes, category, due date, priority indicator, completion checkbox, and delete control.

New Task

Opens the task creation/edit form.

Creating and Editing a Task

A task is created or updated, using the bottom-sheet form. It collects the title of a task and its notes, and then lets you select the priority, category, and due date ahead of saving.

The image shows a mobile app interface for editing a task. At the top, there's a header with a green checkmark icon, the text 'Tasky', and '0 of 6 completed'. Below this is a progress bar labeled 'Your progress' with '0%'. The main form is titled 'Edit task' and contains several sections: 'Title' with the text 'Complete Mobile App Assignment'; 'Notes' with the text 'Finish the Tasky documentation and prepare the submission.'; 'Priority' with three buttons: 'Low', 'Medium', and 'High' (selected with a checkmark); 'Category' with four buttons: 'Personal', 'Work', 'Study' (selected), and 'Health'; and 'Due date' with a text field containing 'Today' and a 'Pick' button. At the bottom is a large blue button labeled 'Save changes'.

Task Creation Workflow

Step 1: Tap New task on the main screen.

Step 2: Enter a descriptive task title.

Step 3: Optionally enter notes with additional information.

Step 4: Select Low, Medium, or High priority.

Step 5: Select Personal, Work, Study, or Health.

Step 6: Choose a due date using Pick.

Step 7: Tap Save changes to store the task.

The same form is used when editing an existing task. Previously stored values are loaded into the fields, allowing the user to modify the task and save the changes.

Task Organization and Due Dates

Priority and Category

Each task can be given a Priority of Low, Medium, or High, and a Category of Personal, Work, Study, or Health. These two features together give a quick indication of the task's level of urgency and what area of life it relates to.

Priority

Low

Medium

✓ High

Category

Personal

Work

Study

Health

Due Date Selection

The Due date field opens a calendar picker. A selected date is stored with the task and is used by the Today, Upcoming, and Overdue filters.

Search, Filters, and Completion

Search

The search field offers live filtering while the user types. Tasky searches the title, notes, and category of a task, and lets the user find relevant tasks without having to go through the whole list manually.

Status Filters

The filter controls separate tasks by their current status: All, Today, Upcoming, Overdue, and Done. The selected filter is visually highlighted.

Completion and Progress

A task can be marked complete using its checkbox. Completed tasks are visually distinguished and can be viewed through the Done filter. The progress card updates to show the number and percentage of completed tasks.

Technical Implementation

Component	Implementation
Language	Kotlin
UI Framework	Jetpack Compose
Design System	Material 3
UI Design & Prototyping	Figma
Architecture	Compose UI > TaskViewModel > TaskDao > Room Database
Local Database	Room
Asynchronous Data	Kotlin Coroutines and Flow
Date Handling	Java LocalDate / epoch-day representation
Development Environment	Android Studio
Storage Model	Local device storage; no network service is required for task data

Data Flow

User actions in the Compose interface are handled by the TaskViewModel. The ViewModel communicates with the TaskDao, which reads and writes Task entities in the Room database. Room exposes the task list as a Flow, allowing the interface to react to changes such as creation, editing, deletion, and completion.
